Function Practice Exercises

Problems are arranged in increasing difficulty:

- Warmup - these can be solved using basic comparisons and methods
- Level 1 - these may involve if/then conditional statements and simple methods
- Level 2 - these may require iterating over sequences, usually with some kind of loop
- Challenging - these will take some creativity to solve

WARMUP SECTION:

LESSER OF TWO EVENS: Write a function that returns the lesser of two given numbers *if* both numbers are even, but returns the greater if one or both numbers are odd

```
lesser_of_two_evens(2,4) --> 2
lesser_of_two_evens(2,5) --> 5
```

```
In [ ]: def lesser_of_two_evens(a,b):
        pass
```

```
In [ ]: # Check
        lesser_of_two_evens(2,4)
```

```
In [ ]: # Check
        lesser_of_two_evens(2,5)
```

ANIMAL CRACKERS: Write a function takes a two-word string and returns True if both words begin with same letter

```
animal_crackers('Levelheaded Llama') --> True
animal_crackers('Crazy Kangaroo') --> False
```

```
In [ ]: def animal_crackers(text):
        pass
```

```
In [ ]: # Check
        animal_crackers('Levelheaded Llama')
```

```
In [ ]: # Check
        animal_crackers('Crazy Kangaroo')
```

THE OTHER SIDE OF SEVEN: Given a value, return a value that is

twice as far away on the other side of 7

```
other_side_of_seven(4) --> 13
other_side_of_seven(12) --> -3
```

```
In [ ]: def other_side_of_seven(num):
        pass
```

```
In [ ]: # Check
        other_side_of_seven(4)
```

```
In [ ]: # Check
        other_side_of_seven(12)
```

LEVEL 1 PROBLEMS

OLD MACDONALD: Write a function that capitalizes the first and fourth letters of a name

```
old_macdonald('macdonald') --> MacDonald
```

Note: 'macdonald'.capitalize() returns 'Macdonald'

```
In [ ]: def old_macdonald(name):
        pass
```

```
In [ ]: # Check
        old_macdonald('macdonald')
```

MASTER YODA: Given a sentence, return a sentence with the words reversed

```
master_yoda('I am home') --> 'home am I'
master_yoda('We are ready') --> 'ready are We'
```

```
In [ ]: def master_yoda(text):
        pass
```

```
In [ ]: # Check
        master_yoda('I am home')
```

```
In [ ]: # Check
        master_yoda('We are ready')
```

ALMOST THERE: Given an integer n, return True if n is within 10 of either 100 or 200

```
almost_there(90) --> True
almost_there(104) --> True
almost_there(150) --> False
almost_there(209) --> True
```

NOTE: `abs(num)` returns the absolute value of a number

```
In [ ]: def almost_there(n):
        pass
```

```
In [ ]: # Check
        almost_there(104)
```

```
In [ ]: # Check
        almost_there(150)
```

```
In [ ]: # Check
        almost_there(209)
```

LEVEL 2 PROBLEMS

LAUGHTER: Write a function that counts the number of times a given pattern appears in a string, *including overlap*

```
laughter('hah', 'hahahah') --> 3
```

Note that `'hahahah'.count('hah')` only returns 2.

```
In [ ]: def laughter(pattern, text):
        pass
```

```
In [ ]: # Check
        laughter('hah', 'hahahah')
```

PAPER DOLL: Given a string, return a string where for every character in the original there are three characters

```
paper_doll('Hello') --> 'HHHeeellllllooo'
paper_doll('Mississippi') --> 'MMMiiissssssiippppppiiii'
```

```
In [ ]: def paper_doll(text):
        pass
```

```
In [ ]: # Check
        paper_doll('Hello')
```

```
paper_doll('Hello')
```

```
In [ ]: # Check
        paper_doll('Mississippi')
```

BLACKJACK: Given three integers between 1 and 11, if their sum is less than or equal to 21, return their sum. If their sum exceeds 21 *and* there's an eleven, reduce the total sum by 10. Finally, if the sum (even after adjustment) exceeds 21, return 'BUST'

```
blackjack(5,6,7) --> 18
blackjack(9,9,9) --> 'BUST'
blackjack(9,9,11) --> 19
```

```
In [ ]: def blackjack(a,b,c):
        pass
```

```
In [ ]: # Check
        blackjack(5,6,7)
```

```
In [ ]: # Check
        blackjack(9,9,9)
```

```
In [ ]: # Check
        blackjack(9,9,11)
```

SUMMER OF '69: Return the sum of the numbers in the array, except ignore sections of numbers starting with a 6 and extending to the next 9 (every 6 will be followed by at least one 9). Return 0 for no numbers.

```
summer_69([1, 3, 5]) --> 9
summer_69([4, 5, 6, 7, 8, 9]) --> 9
summer_69([2, 1, 6, 9, 11]) --> 14
```

```
In [ ]: def summer_69(arr):
        pass
```

```
In [ ]: # Check
        summer_69([1, 3, 5])
```

```
In [ ]: # Check
        summer_69([4, 5, 6, 7, 8, 9])
```

```
In [ ]: # Check
        summer_69([2, 1, 6, 9, 11])
```

CHALLENGING PROBLEMS

SPY GAME: Write a function that takes in a list of integers and returns True if it contains 007 in order

```
spy_game([1,2,4,0,0,7,5]) --> True
spy_game([1,0,2,4,0,5,7]) --> True
spy_game([1,7,2,0,4,5,0]) --> False
```

```
In [ ]: def spy_game(nums):
        pass
```

```
In [ ]: # Check
        spy_game([1,2,4,0,0,7,5])
```

```
In [ ]: # Check
        spy_game([1,0,2,4,0,5,7])
```

```
In [ ]: # Check
        spy_game([1,7,2,0,4,5,0])
```

COUNT PRIMES: Write a function that returns the *number* of prime numbers that exist up to and including a given number

```
count_primes(100) --> 25
```

By convention, 0 and 1 are not prime.

```
In [ ]: def count_primes(num):
        pass
```

```
In [ ]: # Check
        count_primes(100)
```

Just for fun:

PRINT BIG: Write a function that takes in a single letter, and returns a 5x5 representation of that letter

```
print_big('a')
```

```
out:  *
      * *
      *****
      *   *
```
