Function Practice Exercises - Solutions

Problems are arranged in increasing difficulty:

- Warmup these can be solved using basic comparisons and methods
- Level 1 these may involve if/then conditional statements and simple methods
- Level 2 these may require iterating over sequences, usually with some kind of loop
- Challenging these will take some creativity to solve

WARMUP SECTION:

LESSER OF TWO EVENS: Write a function that returns the lesser of two given numbers *if* both numbers are even, but returns the greater if one or both numbers are odd

```
lesser_of_two_evens(2,4) --> 2
lesser_of_two_evens(2,5) --> 5
```

```
def lesser_of_two_evens(a,b):
    if a%2 == 0 and b%2 == 0:
```

```
return min(a,p)
             else:
                return max(a,b)
In [2]:
         # Check
         lesser of two evens(2,4)
Out[2]: 2
In [3]:
         # Check
         lesser of two evens(2,5)
Out[3]: 5
        ANIMAL CRACKERS: Write a function takes a two-word string and returns True if both words begin with
        same letter
            animal crackers('Levelheaded Llama') --> True
            animal crackers('Crazy Kangaroo') --> False
In [4]:
         def animal crackers(text):
             wordlist = text.split()
             return wordlist[0][0] == wordlist[1][0]
In [5]:
         # Check
         animal crackers('Levelheaded Llama')
Out[5]: True
In [6]:
         # Check
         animal_crackers('Crazy Kangaroo')
Out[6]: False
```

MAKES TWENTY: Given two integers, return True if the sum of the integers is 20 or if one of the integers is

20. If not, return False

```
makes_twenty(20,10) --> True
             makes_twenty(12,8) --> True
             makes twenty(2,3) --> False
 In [7]:
          def makes twenty(n1,n2):
              return (n1+n2)==20 or n1==20 or n2==20
 In [8]:
          # Check
          makes_twenty(20,10)
 Out[8]: True
 In [9]:
          # Check
          makes_twenty(12,8)
 Out[9]: True
In [10]:
          #Check
          makes_twenty(2,3)
Out[10]: False
```

LEVEL 1 PROBLEMS

OLD MACDONALD: Write a function that capitalizes the first and fourth letters of a name

```
old_macdonald('macdonald') --> MacDonald
```

Note: 'macdonald'.capitalize() returns 'Macdonald'

```
In [11]:
          def old macdonald(name):
              if len(name) > 3:
                  return name[:3].capitalize() + name[3:].capitalize()
              else:
                  return 'Name is too short!'
In [12]:
          # Check
          old macdonald('macdonald')
Out[12]: 'MacDonald'
         MASTER YODA: Given a sentence, return a sentence with the words reversed
             master yoda('I am home') --> 'home am I'
             master yoda('We are ready') --> 'ready are We'
In [13]:
          def master yoda(text):
              return ' '.join(text.split()[::-1])
In [14]:
          # Check
          master yoda('I am home')
Out[14]: 'home am I'
In [15]:
          # Check
          master yoda('We are ready')
Out[15]: 'ready are We'
         ALMOST THERE: Given an integer n, return True if n is within 10 of either 100 or 200
             almost_there(90) --> True
             almost_there(104) --> True
             almost_there(150) --> False
             almost_there(209) --> True
```

NOTE: abs(num) returns the absolute value of a number

```
In [16]:
          def almost there(n):
              return ((abs(100 - n) <= 10) or (abs(200 - n) <= 10))
In [17]:
          # Check
          almost there(90)
Out[17]: True
In [18]:
          # Check
          almost_there(104)
Out[18]: True
In [19]:
          # Check
          almost_there(150)
Out[19]: False
In [20]:
          # Check
          almost_there(209)
Out[20]: True
```

LEVEL 2 PROBLEMS

FIND 33:

Given a list of ints, return True if the array contains a 3 next to a 3 somewhere.

```
has_33([1, 3, 3]) \rightarrow True
             has_33([1, 3, 1, 3]) \rightarrow False
             has_33([3, 1, 3]) \rightarrow False
In [21]:
          def has 33(nums):
              for i in range(0, len(nums)-1):
                  # nicer looking alternative in commented code
                  #if nums[i] == 3 and nums[i+1] == 3:
                  if nums[i:i+2] == [3,3]:
                       return True
              return False
In [22]:
          # Check
          has_33([1, 3, 3])
Out[22]: True
In [23]:
          # Check
          has_33([1, 3, 1, 3])
Out[23]: False
In [24]:
          # Check
          has_33([3, 1, 3])
Out[24]: False
          PAPER DOLL: Given a string, return a string where for every character in the original there are three
         characters
             paper_doll('Hello') --> 'HHHeeellllllooo'
             paper_doll('Mississippi') --> 'MMMiiissssssiiippppppiii'
```

```
In [25]:
          def paper doll(text):
              result = ''
              for char in text:
                  result += char * 3
              return result
In [26]:
          # Check
          paper doll('Hello')
Out[26]: 'HHHeeellllllooo'
In [27]:
          # Check
          paper doll('Mississippi')
Out[27]: 'MMMiiissssssiiissssssiiippppppiii'
         BLACKJACK: Given three integers between 1 and 11, if their sum is less than or equal to 21, return their sum.
         If their sum exceeds 21 and there's an eleven, reduce the total sum by 10. Finally, if the sum (even after
         adjustment) exceeds 21, return 'BUST'
             blackjack(5,6,7) --> 18
             blackjack(9,9,9) --> 'BUST'
             blackjack(9,9,11) --> 19
In [28]:
          def blackjack(a,b,c):
              if sum((a,b,c)) <= 21:
                  return sum((a,b,c))
              elif sum((a,b,c)) <=31 and 11 in (a,b,c):
                  return sum((a,b,c)) - 10
              else:
                  return 'BUST'
In [29]:
          # Check
          blackjack(5,6,7)
```

```
Out[29]: 18
In [30]:
             # Check
             blackjack(9,9,9)
Out[30]: 'BUST'
In [31]:
             # Check
             blackjack(9,9,11)
Out[31]: 19
            SUMMER OF '69: Return the sum of the numbers in the array, except ignore sections of numbers starting with a 6 and extending to the next 9 (every 6 will be followed by at least one 9). Return 0 for no numbers.
                 summer_69([1, 3, 5]) \longrightarrow 9
                 summer 69([4, 5, 6, 7, 8, 9]) \longrightarrow 9
                 summer 69([2, 1, 6, 9, 11]) \longrightarrow 14
In [32]:
             def summer 69(arr):
                  total = 0
                  add = True
                  for num in arr:
                       while add:
                            if num != 6:
                                 total += num
                                 break
                            else:
                                 add = False
                       while not add:
                            if num != 9:
                                 break
                            else:
                                 add = True
                                 break
                  return total
```

In [33]: | # Check

CHALLENGING PROBLEMS

SPY GAME: Write a function that takes in a list of integers and returns True if it contains 007 in order

```
spy_game([1,2,4,0,0,7,5]) --> True
spy_game([1,0,2,4,0,5,7]) --> True
spy_game([1,7,2,0,4,5,0]) --> False
```

```
In [36]:
    def spy_game(nums):
        code = [0,0,7,'x']
        for num in nums:
            if num == code[0]:
                code.pop(0)  # code.remove(num) also works
        return len(code) == 1
```

```
In [37]: # Check
spy_game([1,2,4,0,0,7,5])
```

```
Out[37]: True
In [38]:
          # Check
          spy game([1,0,2,4,0,5,7])
Out[38]: True
In [39]:
          # Check
          spy game([1,7,2,0,4,5,0])
Out[39]: False
         COUNT PRIMES: Write a function that returns the number of prime numbers that exist up to and including
         a given number
             count primes(100) --> 25
         By convention, 0 and 1 are not prime.
In [40]:
          def count primes(num):
              primes = [2]
              x = 3
              if num < 2: # for the case of num = 0 or 1</pre>
                  return 0
              while x <= num:</pre>
                  for y in range(3,x,2): # test all odd factors up to x-1
                      if x%y == 0:
                          x += 2
                          break
                  else:
```

primes.append(x)

x += 2

print(primes)
return len(primes)

```
In [41]:
           # Check
          count_primes(100)
          [2, 3, 5, 7, 11, 13, 17, 19, 23, 29, 31, 37, 41, 43, 47, 53, 59, 61, 67, 71, 73, 79, 83, 89, 97]
Out[41]: 25
          BONUS: Here's a faster version that makes use of the prime numbers we're collecting as we go!
In [42]:
          def count primes2(num):
               primes = [2]
               x = 3
               if num < 2:
                   return 0
               while x <= num:</pre>
                   for y in primes: # use the primes list!
                       if x%y == 0:
                           x += 2
                           break
                   else:
                       primes.append(x)
                       x += 2
               print(primes)
               return len(primes)
In [43]:
          count primes2(100)
          [2, 3, 5, 7, 11, 13, 17, 19, 23, 29, 31, 37, 41, 43, 47, 53, 59, 61, 67, 71, 73, 79, 83, 89, 97]
Out[43]: 25
```

Just for fun, not a real problem:)

PRINT BIG: Write a function that takes in a single letter, and returns a 5x5 representation of that letter

```
print_big('a')
out: *
```

* * **** * *

HINT: Consider making a dictionary of possible patterns, and mapping the alphabet to specific 5-line combinations of patterns. For purposes of this exercise, it's ok if your dictionary stops at "E".
